Welcome to tree's documentation!

This is the Sphinx documentation for the Python product tree

- What's new in tree?
- intro

CHAPTER 1

Reference

1.1 tree Reference

1.1.1 Tree

```
class tree.tree.Tree(*args, **kwargs)
    Bases: object
```

Initialize the sdss tree object

This class provides Python programmatic access to the SDSS tree environment structure

Parameters

- **key** (*str/list*) – A section or list of sections of the tree to add into the local environment
- **uproot_with** (*str*) – A new TREE_DIR path used to override an existing TREE_DIR environment variable

Variables

- **treedir** (*str*) – The directory of the tree
- **environ** (*dict*) – The fully loaded SDSS config file

```
addPathsToOS(key=None)
```

Add the paths in tree environ into the os environ

This code goes through the tree environ and checks for existence in the os environ, then adds them

Parameters **key** (*str*) – The section name to check against / add

```
branchOut(limb=None)
```

Set the individual section branches

This adds the various sections of the config file into the tree environment for access later. Optically can specify a specific branch.

Parameters **branch** (*str/list*) – The name of the section of the config to add into the environ or a list of strings

checkPaths (*paths*)

Check if the path is in the os environ, and if not add it

Paramters:

paths (OrderedDict): An ordered dict containing all of the paths from the a given section, as key:val = name:path

getPaths (*key*)

Retrieve a set of environment paths from the config

Parameters **key** (*str*) – The section name to grab from the environment

Returns *self.environ[newkey]* (*OrderedDict*) – An ordered dict containing all of the paths from the specified section, as key:val = name:path

loadConfig()

loads the sdsswork config file

setRoots (*uproot_with=None*)

Set the roots of the tree in the os environment

Parameters **uproot_with** (*str*) – A new TREE_DIR path used to override an existing TREE_DIR environment variable
